### MCQ Question 1

[View this Question Online >](#)

The third term of a G.P. is 9. The product of its first five terms is

1.  $3^5$

2.  $3^9$

3.  $3^{10}$

4.  $3^{12}$

**Answer** (Detailed Solution Below)

Option 3 :  $3^{10}$

Let's discuss the concepts related to [Sequences and Series](#) and Geometric Progressions. Explore more from [Mathematics](#) here. Learn now!

### Geometric Progressions MCQ Question 1 Detailed Solution

#### Concept:

#### Five terms in a geometric progression:

If a G.P. has first term  $a$  and common ratio  $r$  then the five consecutive terms in the GP are of the form  $\frac{a}{r^2}, \frac{a}{r}, a, ar, ar^2$ .

#### Calculation:

Let us consider a general geometric progression with common ratio  $r$ .

Assume that the five terms in the GP are  $\frac{a}{r^2}, \frac{a}{r}, a, ar, ar^2$ .

It is given that third term is 9.

Therefore,  $a = 9$ .

Now the product of the five terms is given as follows:

$$\frac{a}{r^2} \times \frac{a}{r} \times a \times ar \times ar^2 = a^5$$

But we know that  $a = 9$ .

Thus, the product is  $9^5 = 3^{10}$ .

## MCQ Question 2

[View this Question Online >](#)

For what possible value of  $x$  are the numbers  $-2/7$ ,  $x$ ,  $-7/2$  are in a GP ?

1.  $-1$ 2.  $1$ 

3. Both 1 and 2

4. None of these

**Answer** (Detailed Solution Below)

Option 3 : Both 1 and 2

**Geometric Progressions MCQ Question 2 Detailed Solution**

**CONCEPT:**

If  $a$ ,  $b$  and  $c$  are in a GP then  $b^2 = ac$

**CALCULATION:**

Given: The numbers  $-2/7$ ,  $x$ ,  $-7/2$  are in GP

As we know that, if  $a$ ,  $b$  and  $c$  are in GP then  $b^2 = ac$

Here,  $a = -2/7$ ,  $b = x$  and  $c = -7/2$

$$\Rightarrow x^2 = (-2/7) \times (-7/2) = 1$$

$$\Rightarrow x = \pm 1$$

Hence, correct option is 3.

## MCQ Question 3

[View this Question Online >](#)

In a G.P. of positive terms, if every term is equal to the sum of next two terms. Then find the common ratio of the G.P.

1.  $2 \sin 18^\circ$

2.  $2 \sin 72^\circ$

3.  $2 \cos 18^\circ$

4.  $\cos 72^\circ$

**Answer** (Detailed Solution Below)Option 1 :  $2 \sin 18^\circ$ **Geometric Progressions MCQ Question 3 Detailed Solution**Concept:Let us consider sequence  $a_1, a_2, a_3, \dots, a_n$  is a G.P.

- Common ratio  $= r = \frac{a_2}{a_1} = \frac{a_3}{a_2} = \dots = \frac{a_n}{a_{n-1}}$
- $n^{\text{th}}$  term of the G.P. is  $a_n = ar^{n-1}$

$$\sin 18^\circ = \frac{\sqrt{5}-1}{4}$$

**Calculation:**

We know that if the first term of a G.P. is 'a' and the common ratio is 'r' then in this case then G.P. = a,

ar, ar<sup>2</sup>.....

Since we have given  $a = ar + ar^2$

Now,  $1 = r + r^2$

$$\Rightarrow r^2 + r - 1 = 0$$

After solving we get  $r = \frac{\sqrt{5}-1}{2} = 2 \times \frac{\sqrt{5}-1}{4} = 2 \sin 18^\circ$

#### MCQ Question 4

[View this Question Online >](#)

A man has 2 parents, 4 grandparents, 8 great-grand parents, and so on . Find the number of ancestors during the 8 generations preceding his own .

1. 255

2. 450

3. 505

4. 510

**Answer** (Detailed Solution Below)

Option 4 : 510

#### Geometric Progressions MCQ Question 4 Detailed Solution

**Concept:**

Let us consider sequence  $a_1, a_2, a_3, \dots, a_n$  is an G.P

- Sum of  $n$  terms =  $s = \frac{a(r^n - 1)}{r - 1}$ ; where  $r > 1$
- Sum of  $n$  terms =  $s = \frac{a(1 - r^n)}{1 - r}$ ; where  $r < 1$

### Calculation:

The required no. of ancestors

$$= 2 + 4 + 8 + \dots \text{ upto 8 terms}$$

As we know that sum of G.P.,

$$S = \frac{a(r^n - 1)}{r - 1}$$

Where,  $a = 2$ ,  $r = 2$  and  $n = 8$

$$\Rightarrow \text{No. of ancestors required} = \frac{2 \times (2^8 - 1)}{2 - 1} = 2 \times (2^8 - 1) = 510$$

$\therefore$  No. of ancestors required is **510**.

The correct option is 4.

### MCQ Question 5

[View this Question Online >](#)

If the sum of  $n$  numbers in the GP 5, 10, 20, ... is 1275 then  $n$  is ?

1. 6

2. 7

3. 8

4. 9

## Answer (Detailed Solution Below)

Option 3 : 8

### Geometric Progressions MCQ Question 5 Detailed Solution

#### Concept:

Let us consider sequence  $a_1, a_2, a_3, \dots, a_n$  is a G.P.

- Common ratio  $= r = \frac{a_2}{a_1} = \frac{a_3}{a_2} = \dots = \frac{a_n}{a_{n-1}}$
- $n^{\text{th}}$  term of the G.P. is  $a_n = ar^{n-1}$
- Sum of  $n$  terms of GP  $= s_n = \frac{a(r^n - 1)}{r - 1}$ ; where  $r > 1$
- Sum of  $n$  terms of GP  $= s_n = \frac{a(1 - r^n)}{1 - r}$ ; where  $r < 1$
- Sum of infinite GP  $= s_\infty = \frac{a}{1 - r}$ ;  $|r| < 1$

#### Calculation:

Given series is 5, 10, 20, ...

Here,  $a = 5, r = 2$

Sum of  $n$  numbers  $= s_n = 1275$

To Find:  $n$  As we know that, Sum of  $n$  terms of GP  $= s_n = \frac{a(r^n - 1)}{r - 1}$ ; where  $r > 1$

$$\therefore s_n = \frac{5(2^n - 1)}{2 - 1}$$

$$1275 = 5 \times (2^n - 1)$$

$$\Rightarrow 255 = (2^n - 1)$$

$$\Rightarrow 2^n = 256$$

$$\Rightarrow 2^n = 2^8$$

$$\therefore n = 8$$

## MCQ Question 6

[View this Question Online >](#)

The third term of a GP is 3. What is the product of its first five terms?

1. 81

2. 243

3. 729

4. Cannot be determined due to insufficient data

**Answer** (Detailed Solution Below)

Option 2 : 243

**Geometric Progressions MCQ Question 6 Detailed Solution****Concept:**

Let us consider sequence  $a_1, a_2, a_3, \dots, a_n$  is a G.P.

$$\text{Common ratio} = r = \frac{a_2}{a_1} = \frac{a_3}{a_2} = \frac{a_n}{a_{n-1}}$$

**Calculation:**

Consider,

( $a = 3$ ) be the 3<sup>rd</sup> term of the G.P series,

So, we can write the five terms as,

$$\frac{a}{r^2}, \frac{a}{r}, a, ar, ar^2$$

So, the product of the five terms (P) will be,

$$P = \frac{a}{r^2} \times \frac{a}{r} \times a \times ar \times ar^2 = a^5$$

Since,

$$a = 3,$$

$\therefore$  The product of the first five terms (P) =  $3^5 = 243$

### MCQ Question 7

[View this Question Online >](#)

The value of  $9^{\frac{1}{3}} + 9^{\frac{1}{3}} + 9^{\frac{1}{3}} + \dots \infty$  is:

1. 3
2. 6
3. 9
4. None of these

**Answer** (Detailed Solution Below)

Option 1 : 3

### Geometric Progressions MCQ Question 7 Detailed Solution

Concept:

**Geometric Progression (GP):**

- The series of numbers where the ratio of any two consecutive terms is the same is called a Geometric Progression.
- A Geometric Progression of  $n$  terms with **first term  $a$**  and **common ratio  $r$**  is represented as:

$$a, ar, ar^2, ar^3, \dots, ar^{n-2}, ar^{n-1}.$$

- The **sum of the first n terms** of a GP is:  $S_n = a \left( \frac{r^n - 1}{r - 1} \right)$ .
- The **sum to  $\infty$**  of a GP, when  $|r| < 1$ , is:  $S_\infty = \frac{a}{1-r}$ .

### Calculation:

Let us consider the infinite series  $\frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \dots \infty$ .

Here,  $a = \frac{1}{3}$  and  $r = \frac{\frac{1}{9}}{\frac{1}{3}} = \frac{1}{3}$ .

$$\therefore S_\infty = \frac{a}{1-r} = \frac{\frac{1}{3}}{1-\frac{1}{3}} = \frac{\frac{1}{3}}{\frac{2}{3}} = \frac{1}{2}.$$

Now, let  $P = 9^{\frac{1}{3}} 9^{\frac{1}{9}} 9^{\frac{1}{27}} \dots \infty$ .

$$\therefore P = 9^{\frac{1}{3} + \frac{1}{9} + \frac{1}{27} + \dots \infty} = 9^{\frac{1}{2}} = \sqrt{9} = 3.$$

### MCQ Question 8

[View this Question Online >](#)

For the series  $1 + 3 + 3^2 + \dots$ , the sum to n terms is 3280. Find the value of n.

1. 6

2. 8

3. 10

4. 12

## Answer (Detailed Solution Below)

Option 2 : 8

### Geometric Progressions MCQ Question 8 Detailed Solution

Concept:

**Geometric Progression (GP):** The series of numbers where the ratio of any two consecutive terms is the same, is called a Geometric Progression.

- A Geometric Progression of  $n$  terms with first term  $a$  and common ratio  $r$  is represented as:

$$a, ar, ar^2, ar^3, \dots, ar^{n-2}, ar^{n-1}.$$

- The sum of the first  $n$  terms of a GP is:

$$S_n = a \left( \frac{r^n - 1}{r - 1} \right).$$

Calculation:

For the given geometric series  $1 + 3 + 3^2 + \dots$ , we have  $a = 1$  and  $r = 3$ .

Let the sum of first  $n$  terms be equal to 3280.

$$\therefore S_n = 1 \left( \frac{3^n - 1}{3 - 1} \right) = 3280$$

$$\Rightarrow 3^n - 1 = 6560$$

$$\Rightarrow 3^n = 6561 = 3^8$$

$$\Rightarrow n = 8.$$

### MCQ Question 9

[View this Question Online >](#)

If the sum of  $n$  numbers in the GP 4, 8, 16, ... is 2044 then  $n$  is ?

1. 6

2. 7

3. 8

4. 9

**Answer** (Detailed Solution Below)

Option 4 : 9

### Geometric Progressions MCQ Question 9 Detailed Solution

#### Concept:

Let us consider sequence  $a_1, a_2, a_3, \dots, a_n$  is a G.P.

- Common ratio  $= r = \frac{a_2}{a_1} = \frac{a_3}{a_2} = \dots = \frac{a_n}{a_{n-1}}$
- $n^{\text{th}}$  term of the G.P. is  $a_n = ar^{n-1}$
- Sum of  $n$  terms of GP  $= s_n = \frac{a(r^n - 1)}{r - 1}$ ; where  $r > 1$
- Sum of  $n$  terms of GP  $= s_n = \frac{a(1 - r^n)}{1 - r}$ ; where  $r < 1$
- Sum of infinite GP  $= s_{\infty} = \frac{a}{1 - r}$ ;  $|r| < 1$

#### Calculation:

Given series is 4, 8, 16, ...

Here,  $a = 4, r = 2$

Sum of  $n$  numbers  $= s_n = 2044$

To Find:  $n$  As we know that, Sum of  $n$  terms of GP  $= s_n = \frac{a(r^n - 1)}{r - 1}$ ; where  $r > 1$

$$4(2^n - 1)$$

$$\therefore S_n = \frac{1-2^n}{1-2}$$

$$2044 = 4 \times (2^n - 1)$$

$$\Rightarrow 511 = (2^n - 1)$$

$$\Rightarrow 2^n = 512$$

$$\Rightarrow 2^n = 2^9$$

$$\therefore n = 9$$

### MCQ Question 10

[View this Question Online >](#)

What is the  $n^{\text{th}}$  term of the sequence 25, -125, 625, -3125, .....

1.  $(-5)^{2n-1}$

2.  $(-1)^{2n} 5^{n+1}$

3.  $(-1)^{2n-1} 5^{n+1}$

4.  $(-1)^{n-1} 5^{n+1}$

**Answer** (Detailed Solution Below)

Option 4 :  $(-1)^{n-1} 5^{n+1}$

### Geometric Progressions MCQ Question 10 Detailed Solution

**Concept:**

If  $a_1, a_2, \dots, a_n$  is a GP then the general term is given by:  $a_n = a \times r^{n-1}$  where  $a$  is the 1<sup>st</sup> term and  $r$  is

the common ratio.

**Calculation:**

Given: 25, -125, 625, -3125, .....

Here, first term  $a = 25$  and common ratio  $r = -5$ .

As we know that, if  $a_1, a_2, \dots, a_n$  is a GP then the general term is given by:  $a_n = a \times r^{n-1}$  where  $a$  is the first term and  $r$  is the common ratio.

$\Rightarrow$  The general term is :  $a_n = 25 \times (-5)^{n-1} = (-1)^{n-1} \times 5^{n+1}$
